1. Brand foundation

Project name

Tame the Flame

Full project title

Wildfire Risk Reduction Through Hydrated Vegetated Greenbelt Buffers at the Wildland–Urban Interface

Recommended descriptor

Hydrated landscapes for wildfire resilience

Use the full project title in formal reports, academic materials, and first references. Use Tame the Flame as the short public-facing name in presentations, graphics, outreach materials, and social media

Avoid using “buffer strips” as the primary project name because the project considers a wider range of landscape types, including agricultural lands, riparian corridors, managed open spaces, shaded fuel breaks, and greenbelts

Positioning statement

Tame the Flame examines how alternative water supplies, landscape management, and policy tools can support vegetated greenbelt buffers as one component of broader wildfire resilience in Santa Barbara County

Primary audiences

- Watershed Progressive staff and project partners
- Santa Barbara County Fire Safe Council and RWMP collaborators
- Water agencies, wastewater agencies, and stormwater professionals
- Fire departments, land managers, planners, and regulators
- Agricultural operators and owners of working lands
- Community organizations and residents in WUI areas
- Potential funders and government agencies
- Academic reviewers and technical experts

Core values

Integrated resilience: Connect water, wildfire, land use, infrastructure, and community planning rather than treating them as separate systems

Practicality: Focus on feasible pathways, implementation constraints, and information that can support future decision-making

Evidence: Ground recommendations in spatial data, case studies, policy research, modeling, and practitioner experience

Stewardship: Recognize the ecological, agricultural, cultural, and community value of managed landscapes

Collaboration: Emphasize that implementation will require coordination among agencies, landowners, technical experts, and communities

Adaptability: Communicate uncertainty clearly and allow recommendations to change as new data and implementation experience become available

2. Logo system

Partner logo lockup

The Bren School, Watershed Progressive, Santa Barbara County Fire Safe Council, and RWMP logos are partner marks and should remain separate from the Tame the Flame logo

Recommended structure

Developed by Tame the Flame | Bren School of Environmental Science and Management

In partnership with Watershed Progressive | Santa Barbara County Fire Safe Council

Aligned with Regional Wildfire Mitigation Program

The exact language and logo order should be confirmed with project partners before public release

Logo placement

- Use the project logo as the primary identity on title pages and covers
- Place partner logos in a footer, closing slide, acknowledgments page, or dedicated partnership section
- Give partner logos approximately equal visual weight
- Align logos by optical height rather than exact dimensions
- Place logos on white, warm sand, or another uncluttered background
- Use approved full-color or white logo versions only

Clear space

Maintain clear space around each logo equal to at least: + Half the height of the project submark + Half the height of each partner logo

Minimum sizes

- Primary project logo: 180 pixels wide for digital use
- Secondary stacked logo: 120 pixels wide
- Submark: 32 pixels wide
- Partner logos: large enough for all text to remain legible

Logo misuse

Do not:

- Stretch, compress, rotate, or skew logos
- Recolor partner logos
- Add shadows, outlines, gradients, or effects
- Place logos over visually busy photographs
- Combine partner logos into a new symbol
- Change the proportions or arrangement of existing partner marks
- Place logos too close together
- imply that Tame the Flame is owned by one partner unless formally approved

3. Color palette

The palette connects the visual languages of all four partner organizations while keeping the project from appearing overly colorful

color	primary_use	hex
Watershed Teal	Primary project color, water systems, headings, diagrams	#2F6F78
Chaparral Green	Vegetation, land stewardship, section backgrounds	#1F5B3B
Warm Sand	Main presentation and document background	#F4F0E8
Charcoal	Primary text and linework	#2E3336

color	primary_use	hex
Bren Blue	Water data, academic materials, links, secondary emphasis	#005DA6
Resilience Orange	Wildfire risk, priority actions, calls to attention	#F5824E
Landscape Sage	Restoration, lower-intensity fills, secondary vegetation data	#A4CF7B
Safety Gold	Funding, opportunities, warnings, Fire Safe Council alignment	#FDBD48
Water Mist	Table shading, map backgrounds, diagrams, callout boxes	#DDE7E5
White	Negative space and text on dark backgrounds	#FFFFFF

Color hierarchy

Recommended overall balance:

- 45% warm sand or white
- 25% watershed teal or chaparral green
- 15% charcoal

- 10% blue or sage
- 5% orange or gold

Orange and gold should function as accents rather than dominant page colors

Approved text combinations

Use:

- White or warm sand text on chaparral green
- White or warm sand text on watershed teal
- White text on Bren blue
- White text on charcoal
- Charcoal text on warm sand
- Charcoal text on white
- Charcoal text on water mist
- Charcoal text on landscape sage
- Charcoal text on resilience orange or safety gold

Avoid:

- White text on orange
- White text on sage
- White text on gold
- Charcoal text on teal, green, or blue
- Orange text on white for small body copy
- Green text placed directly over vegetation photography

Data visualization color rules

Use color consistently across all maps, charts, and process diagrams:

- Water availability and infrastructure: watershed teal and Bren blue
- Vegetation and restoration: chaparral green and landscape sage
- Wildfire hazard and exposure: resilience orange
- Funding or opportunity: safety gold
- Existing conditions: charcoal and gray
- Constraints or unavailable areas: muted gray
- Priority VGB opportunity areas: dark green outline with teal fill
- Areas requiring additional review: gold hatch or outline
- Highest-risk areas: orange, not red unless required by an existing agency dataset

Do not use green to indicate “safe” if it is also being used to represent vegetation
